THE GOLFWORKS®

INSTRUCTIONSFOR:

Grip Remover/ Installer Tool

(Air Powered)

Code: **GW0103**

1. Attach The GolfWorks Air Powered Grip Tool to an air compressor. Note: 35 to 45 PSI is recommended. Using over 45 PSI could cause grip damage.

2. Affix the golf club into a shaft clamp.

3. Apply a 9" section of masking tape to shaft butt being careful not to create wrinkles in the tape. Note: This layer of masking tape is needed to ensure the finished grip size will be correct.

4. Dip the mouth of grip in soapy water or grip solvent.

5. Pinch or flatten the open end of the grip and position it over the butt end of the golf shaft.

6. Insert the GolfWorks Air Tool into the vent hole of the grip.

7. Apply small burst of air while pushing the golf grip onto the golf shaft until the grip is fully installed onto the golf shaft. Once the grip is installed, use small burst of air while twisting the grip to properly align.

Note: It is not recommended to remove thin all rubber grips such as a Golf Pride Tour Velvet grip using The GolfWorks Air Powered Grip Tool. Thin all rubber grips could explode when using air pressure to remove. Two piece synthetic grips such as Winn style grips and most cord grips can be easily removed using air pressure.

1. Affix the golf club into a clamp.

2. Insert a thin pointed object into the grip vent hole and puncture through the grip tape inside of the golf shaft.

3. Slide the air gun tube over the grip and insert the air gun stem into the vent hole of the golf grip. The protective air gun tube will protect against physical damage if the grip develops an abnormal air bubble which may cause the grip to explode.

4. Apply small burst of air until the air reaches the mouth of the grip or the grip becomes loose.

5. If the air does not reach the mouth of the grip, remove the Air Powered Grip Removal tool and twist the grip by hand to work the air down the grip until the grip becomes loose.
